“I’ll be honest: I’m guilty of that.”

Facebook's Privacy Policy

“Advertisers, app developers, and publishers...provide information about your activities off Facebook—including information about your device, websites you visit, purchases you make, the ads you see, and how you use their services—whether or not you have a Facebook account or are logged into Facebook. For example, ...a business could tell us about a purchase you made in its store. We also receive information about your online and offline actions and purchases from third-party data providers who have the rights to provide us with your information.”

The amount of personal information collected should be enough to raise privacy concerns. However, the real problems arise when we begin to consider the availability of all of this information...Over the years, there has been a noticeable trend in making more databases available online, as well as offline, because of the ease of data transfer that it allows. Some states, such as Texas, have their birth and death registries online, medical data, including hospital discharge data, is readily available, and even health and criminal records are accessible.

Data security is *monumental* in public health.
